

A Corgi dog is looking into a bathroom mirror. The dog's face is reflected in the mirror, and its head is visible in the foreground on the right. Two yellow rubber ducks are on the sink in front of the mirror. The scene is set in a bathroom with a tiled wall and a silver faucet.

## Optimization with inequality constraints

## Example of inequality constraints

$$f(x) = x_1^2 + x_2^2 \quad g(x) = x_1^2 + x_2^2 - 1$$

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

## Optimization with inequality constraints

Contour lines of  $f(x) = x_1^2 + x_2^2 = C$

## Optimization with inequality constraints

Feasible region  $g(x) = x_1^2 + x_2^2 - 1 \leq 0$

## Optimization with inequality constraints

How to recognize that some feasible point is at local minimum?

## Optimization with inequality constraints

Easy in this case! Just check unconstrained

# Optimization with inequality constraints

Thus, if the constraints of the type of inequalities are inactive in the constrained problem, then don't worry and write out the solution to the unconstrained problem. However, this is not the whole story. Consider the second childish example

$$f(x) = (x_1 - 1)^2 + (x_2 + 1)^2 \quad g(x) = x_1^2 + x_2^2 - 1$$

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

## Optimization with inequality constraints

$$f(x) = (x_1 - 1)^2 + (x_2 + 1)^2 = C$$

## Optimization with inequality constraints

Feasible region  $g(x) = x_1^2 + x_2^2 - 1 \leq 0$

## Optimization with inequality constraints

How to recognize that some feasible point is at local minimum?

## Optimization with inequality constraints

Not very easy in this case! Even gradient  $\neq 0$   
at local optimum 😞

## Optimization with inequality constraints

Effectively have a problem with equality constraints!

$$g(x^*) = 0$$

# Optimization with inequality constraints

## Optimization with inequality constraints

Not a constrained local minimum as  $-\nabla f(x)$  points in towards the feasible region

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

- $g(x) \leq 0$  is inactive.  $g(x^*) < 0$
- $g(x^*) < 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

- $g(x) \leq 0$  is inactive.  $g(x^*) < 0$
- $g(x^*) < 0$
  - $\nabla f(x^*) = 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

$g(x) \leq 0$  is inactive.  $g(x^*) < 0$

- $g(x^*) < 0$
- $\nabla f(x^*) = 0$
- $\nabla^2 f(x^*) > 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

$g(x) \leq 0$  is inactive.  $g(x^*) < 0$

- $g(x^*) < 0$
- $\nabla f(x^*) = 0$
- $\nabla^2 f(x^*) > 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

$g(x) \leq 0$  is inactive.  $g(x^*) < 0$

- $g(x^*) < 0$
- $\nabla f(x^*) = 0$
- $\nabla^2 f(x^*) > 0$

$g(x) \leq 0$  is active.  $g(x^*) = 0$

- $g(x^*) = 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

$g(x) \leq 0$  is inactive.  $g(x^*) < 0$

- $g(x^*) < 0$
- $\nabla f(x^*) = 0$
- $\nabla^2 f(x^*) > 0$

$g(x) \leq 0$  is active.  $g(x^*) = 0$

- $g(x^*) = 0$
- Necessary conditions:  $-\nabla f(x^*) = \lambda \nabla g(x^*)$ ,  $\lambda > 0$

# Optimization with inequality constraints

So, we have a problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Two possible cases:

$g(x) \leq 0$  is inactive.  $g(x^*) < 0$

- $g(x^*) < 0$
- $\nabla f(x^*) = 0$
- $\nabla^2 f(x^*) > 0$

$g(x) \leq 0$  is active.  $g(x^*) = 0$

- $g(x^*) = 0$
- Necessary conditions:  $-\nabla f(x^*) = \lambda \nabla g(x^*)$ ,  $\lambda > 0$
- Sufficient conditions:  
 $\langle y, \nabla_{xx}^2 L(x^*, \lambda^*) y \rangle > 0, \forall y \neq 0 \in \mathbb{R}^n : \nabla g(x^*)^\top y = 0$

# Lagrange function for inequality constraints

Combining two possible cases, we can write down the general conditions for the problem:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned}$$

Let's define the Lagrange function:

$$L(x, \lambda) = f(x) + \lambda g(x)$$

The classical Karush-Kuhn-Tucker first and second-order optimality conditions for a local minimizer  $x^*$ , stated under some regularity conditions, can be written as follows.

## Lagrange function for inequality constraints

Combining two possible cases, we can write down the general conditions for the problem: If  $x^*$  is a local minimum of the problem described above, then there exists a unique Lagrange multiplier  $\lambda^*$  such that:

$$\begin{aligned} f(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) &\leq 0 \end{aligned} \quad (1) \quad \nabla_x L(x^*, \lambda^*) = 0$$

Let's define the Lagrange function:

$$L(x, \lambda) = f(x) + \lambda g(x)$$

The classical Karush-Kuhn-Tucker first and second-order optimality conditions for a local minimizer  $x^*$ , stated under some regularity conditions, can be written as follows.

## Lagrange function for inequality constraints

Combining two possible cases, we can write down the general conditions for the problem: If  $x^*$  is a local minimum of the problem described above, then there exists a unique Lagrange multiplier  $\lambda^*$  such that:

$$\begin{aligned} f(x) \rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } g(x) \leq 0 \end{aligned} \quad \begin{aligned} (1) \quad & \nabla_x L(x^*, \lambda^*) = 0 \\ (2) \quad & \lambda^* \geq 0 \end{aligned}$$

Let's define the Lagrange function:

$$L(x, \lambda) = f(x) + \lambda g(x)$$

The classical Karush-Kuhn-Tucker first and second-order optimality conditions for a local minimizer  $x^*$ , stated under some regularity conditions, can be written as follows.

## Lagrange function for inequality constraints

Combining two possible cases, we can write down the general conditions for the problem: If  $x^*$  is a local minimum of the problem described above, then there exists a unique Lagrange multiplier  $\lambda^*$  such that:

$$\begin{array}{ll} f(x) \rightarrow \min_{x \in \mathbb{R}^n} & (1) \nabla_x L(x^*, \lambda^*) = 0 \\ \text{s.t. } g(x) \leq 0 & (2) \lambda^* \geq 0 \\ & (3) \lambda^* g(x^*) = 0 \end{array}$$

Let's define the Lagrange function:

$$L(x, \lambda) = f(x) + \lambda g(x)$$

The classical Karush-Kuhn-Tucker first and second-order optimality conditions for a local minimizer  $x^*$ , stated under some regularity conditions, can be written as follows.

# Lagrange function for inequality constraints

$$I(x^*) = \{i \mid g_i(x^*) = 0\}$$

Let's define the Lagrange function:

$$L(x, \lambda) = f(x) + \lambda g(x)$$

The classical Karush-Kuhn-Tucker first and second-order optimality conditions for a local minimizer  $x^*$ , stated under some regularity conditions, can be written as follows.

KKT

# General formulation

$$\begin{aligned} f_0(x) &\rightarrow \min_{x \in \mathbb{R}^n} \\ \text{s.t. } f_i(x) &\leq 0, \quad i = 1, \dots, m \\ h_i(x) &= 0, \quad i = 1, \dots, p \end{aligned}$$

This formulation is a general problem of mathematical programming.

The solution involves constructing a Lagrange function:

$$L(x, \lambda, \nu) = f_0(x) + \sum_{i=1}^m \lambda_i f_i(x) + \sum_{i=1}^p \nu_i h_i(x)$$

## Necessary conditions

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

- $\nabla_x L(x^*, \lambda^*, \nu^*) = 0$

## Necessary conditions

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

- $\nabla_x L(x^*, \lambda^*, \nu^*) = 0$
- $\nabla_\nu L(x^*, \lambda^*, \nu^*) = 0$

## Necessary conditions

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

- $\nabla_x L(x^*, \lambda^*, \nu^*) = 0$
- $\nabla_\nu L(x^*, \lambda^*, \nu^*) = 0$
- $\lambda_i^* \geq 0, i = 1, \dots, m$

## Necessary conditions

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

- $\nabla_x L(x^*, \lambda^*, \nu^*) = 0$
- $\nabla_\nu L(x^*, \lambda^*, \nu^*) = 0$
- $\lambda_i^* \geq 0, i = 1, \dots, m$
- $\lambda_i^* f_i(x^*) = 0, i = 1, \dots, m$

## Necessary conditions

Let  $x^*$ ,  $(\lambda^*, \nu^*)$  be a solution to a mathematical programming problem with zero duality gap (the optimal value for the primal problem  $p^*$  is equal to the optimal value for the dual problem  $d^*$ ). Let also the functions  $f_0, f_i, h_i$  be differentiable.

- $\nabla_x L(x^*, \lambda^*, \nu^*) = 0$
- $\nabla_\nu L(x^*, \lambda^*, \nu^*) = 0$
- $\lambda_i^* \geq 0, i = 1, \dots, m$
- $\lambda_i^* f_i(x^*) = 0, i = 1, \dots, m$
- $f_i(x^*) \leq 0, i = 1, \dots, m$

## Some regularity conditions

These conditions are needed to make KKT solutions the necessary conditions. Some of them even turn necessary conditions into sufficient (for example, Slater's). Moreover, if you have regularity, you can write down necessary second order conditions  $\langle y, \nabla_{xx}^2 L(x^*, \lambda^*, \nu^*) y \rangle \geq 0$  with *semi-definite* hessian of Lagrangian.

- **Slater's condition.** If for a convex problem (i.e., assuming minimization,  $f_0, f_i$  are convex and  $h_i$  are affine), there exists a point  $x$  such that  $h(x) = 0$  and  $f_i(x) < 0$  (existence of a strictly feasible point), then we have a zero duality gap and KKT conditions become necessary and sufficient.

## Some regularity conditions

These conditions are needed to make KKT solutions the necessary conditions. Some of them even turn necessary conditions into sufficient (for example, Slater's). Moreover, if you have regularity, you can write down necessary second order conditions  $\langle y, \nabla_{xx}^2 L(x^*, \lambda^*, \nu^*) y \rangle \geq 0$  with *semi-definite* hessian of Lagrangian.

- **Slater's condition.** If for a convex problem (i.e., assuming minimization,  $f_0, f_i$  are convex and  $h_i$  are affine), there exists a point  $x$  such that  $h(x) = 0$  and  $f_i(x) < 0$  (existence of a strictly feasible point), then we have a zero duality gap and KKT conditions become necessary and sufficient.
- **Linearity constraint qualification.** If  $f_i$  and  $h_i$  are affine functions, then no other condition is needed.

## Some regularity conditions

These conditions are needed to make KKT solutions the necessary conditions. Some of them even turn necessary conditions into sufficient (for example, Slater's). Moreover, if you have regularity, you can write down necessary second order conditions  $\langle y, \nabla_{xx}^2 L(x^*, \lambda^*, \nu^*) y \rangle \geq 0$  with *semi-definite* hessian of Lagrangian.

- **Slater's condition.** If for a convex problem (i.e., assuming minimization,  $f_0, f_i$  are convex and  $h_i$  are affine), there exists a point  $x$  such that  $h(x) = 0$  and  $f_i(x) < 0$  (existence of a strictly feasible point), then we have a zero duality gap and KKT conditions become necessary and sufficient.
- **Linearity constraint qualification.** If  $f_i$  and  $h_i$  are affine functions, then no other condition is needed.
- **Linear independence constraint qualification.** The gradients of the active inequality constraints and the gradients of the equality constraints are linearly independent at  $x^*$ .

- **Linear independence constraint qualification.** The gradients of the active inequality constraints and the gradients of the equality constraints are linearly independent at  $x^*$ .
- For other examples, see wiki.

## Proof in simple case

### i Subdifferential form of KKT

Let  $X$  be a linear normed space, and let  $f_j : X \rightarrow \mathbb{R}$ ,  $j = 0, 1, \dots, m$ , be convex proper (it never takes on the value  $-\infty$  and also is not identically equal to  $\infty$ ) functions. Consider the problem

$$\begin{aligned} f_0(x) &\rightarrow \min_{x \in X} \\ \text{s.t. } f_j(x) &\leq 0, \quad j = 1, \dots, m \end{aligned}$$

Let  $x^* \in X$  be a minimum in problem above and the functions  $f_j$ ,  $j = 0, 1, \dots, m$ , be continuous at the point  $x^*$ . Then there exist numbers  $\lambda_j \geq 0$ ,  $j = 0, 1, \dots, m$ , such that

$$\begin{aligned} \sum_{j=0}^m \lambda_j &= 1, \\ \lambda_j f_j(x^*) &= 0, \quad j = 1, \dots, m, \\ 0 &\in \sum_{j=0}^m \lambda_j \partial f_j(x^*). \end{aligned}$$

# Proof in simple case

## Proof

1. Consider the function

$$f(x) = \max\{f_0(x) - f_0(x^*), f_1(x), \dots, f_m(x)\}.$$

The point  $x^*$  is a global minimum of this function.

Indeed, if at some point  $x_e \in X$  the inequality

$f(x_e) < 0$  were satisfied, it would imply that

$f_0(x_e) < f_0(x^*)$  and  $f_j(x_e) < 0$ ,  $j = 1, \dots, m$ ,

contradicting the minimality of  $x^*$  in problem above.

# Proof in simple case

## Proof

1. Consider the function

$$f(x) = \max\{f_0(x) - f_0(x^*), f_1(x), \dots, f_m(x)\}.$$

The point  $x^*$  is a global minimum of this function.

Indeed, if at some point  $x_e \in X$  the inequality

$f(x_e) < 0$  were satisfied, it would imply that

$f_0(x_e) < f_0(x^*)$  and  $f_j(x_e) < 0$ ,  $j = 1, \dots, m$ ,

contradicting the minimality of  $x^*$  in problem above.

2. Then, from Fermat's theorem in subdifferential form, it follows that

$$0 \in \partial f(x^*).$$

## Proof in simple case

### Proof

1. Consider the function

$$f(x) = \max\{f_0(x) - f_0(x^*), f_1(x), \dots, f_m(x)\}.$$

The point  $x^*$  is a global minimum of this function.

Indeed, if at some point  $x_e \in X$  the inequality

$f_0(x_e) < f_0(x^*)$  and  $f_j(x_e) < 0$ ,  $j = 1, \dots, m$ ,

contradicting the minimality of  $x^*$  in problem above.

2. Then, from Fermat's theorem in subdifferential form, it follows that

$$0 \in \partial f(x^*).$$

3. By the Dubovitskii-Milyutin theorem, we have

$$\partial f(x^*) = \text{conv} \left( \bigcup_{j \in I} \partial f_j(x^*) \right),$$

where  $I = \{0\} \cup \{j : f_j(x^*) = 0, 1 \leq j \leq m\}$ .

## Proof in simple case

### Proof

1. Consider the function

$$f(x) = \max\{f_0(x) - f_0(x^*), f_1(x), \dots, f_m(x)\}.$$

The point  $x^*$  is a global minimum of this function. Indeed, if at some point  $x_e \in X$  the inequality  $f(x_e) < 0$  were satisfied, it would imply that  $f_0(x_e) < f_0(x^*)$  and  $f_j(x_e) < 0$ ,  $j = 1, \dots, m$ , contradicting the minimality of  $x^*$  in problem above.

2. Then, from Fermat's theorem in subdifferential form, it follows that

$$0 \in \partial f(x^*).$$

3. By the Dubovitskii-Milyutin theorem, we have

$$\partial f(x^*) = \text{conv} \left( \bigcup_{j \in I} \partial f_j(x^*) \right),$$

where  $I = \{0\} \cup \{j : f_j(x^*) = 0, 1 \leq j \leq m\}$ .

4. Therefore, there exist  $g_j \in \partial f_j(x^*)$ ,  $j \in I$ , such that

$$\sum_{j \in I} \lambda_j g_j = 0, \quad \sum_{j \in I} \lambda_j = 1, \quad \lambda_j \geq 0, \quad j \in I.$$

It remains to set  $\lambda_j = 0$  for  $j \notin I$ .

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

### Solution

Lagrangian:

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

### Solution

Lagrangian:

$$L(\mathbf{x}, \nu) = \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2 + \nu(\mathbf{a}^T \mathbf{x} - b)$$

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

### Solution

Lagrangian:

$$L(\mathbf{x}, \nu) = \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2 + \nu(\mathbf{a}^T \mathbf{x} - b)$$

Derivative of  $L$  with respect to  $\mathbf{x}$ :

$$\frac{\partial L}{\partial \mathbf{x}} = \mathbf{x} - \mathbf{y} + \nu \mathbf{a} = 0, \quad \mathbf{x} = \mathbf{y} - \nu \mathbf{a}$$

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

### Solution

Lagrangian:

$$L(\mathbf{x}, \nu) = \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2 + \nu(\mathbf{a}^T \mathbf{x} - b)$$

Derivative of  $L$  with respect to  $\mathbf{x}$ :

$$\frac{\partial L}{\partial \mathbf{x}} = \mathbf{x} - \mathbf{y} + \nu \mathbf{a} = 0, \quad \mathbf{x} = \mathbf{y} - \nu \mathbf{a}$$

$$\mathbf{a}^T \mathbf{x} = \mathbf{a}^T \mathbf{y} - \nu \mathbf{a}^T \mathbf{a} \quad \nu = \frac{\mathbf{a}^T \mathbf{y} - b}{\|\mathbf{a}\|^2}$$

## Example. Projection onto a hyperplane

$$\min \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2, \quad \text{s.t.} \quad \mathbf{a}^T \mathbf{x} = b.$$

### Solution

Lagrangian:

$$L(\mathbf{x}, \nu) = \frac{1}{2} \|\mathbf{x} - \mathbf{y}\|^2 + \nu(\mathbf{a}^T \mathbf{x} - b)$$

Derivative of  $L$  with respect to  $\mathbf{x}$ :

$$\frac{\partial L}{\partial \mathbf{x}} = \mathbf{x} - \mathbf{y} + \nu \mathbf{a} = 0, \quad \mathbf{x} = \mathbf{y} - \nu \mathbf{a}$$

$$\mathbf{a}^T \mathbf{x} = \mathbf{a}^T \mathbf{y} - \nu \mathbf{a}^T \mathbf{a} \quad \nu = \frac{\mathbf{a}^T \mathbf{y} - b}{\|\mathbf{a}\|^2}$$

$$\mathbf{x} = \mathbf{y} - \frac{\mathbf{a}^T \mathbf{y} - b}{\|\mathbf{a}\|^2} \mathbf{a}$$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu (x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$
- $\lambda_i \geq 0$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$
- $\lambda_i \geq 0$
- $x^\top \mathbf{1} = 1, \quad x \geq 0$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu (x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$
- $\lambda_i \geq 0$
- $x^\top \mathbf{1} = 1, \quad x \geq 0$

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$
- $\lambda_i \geq 0$
- $x^\top \mathbf{1} = 1, \quad x \geq 0$

#### Question

Solve the above conditions in  $O(n \log n)$  time.

## Example. Projection onto simplex

$$\min \frac{1}{2} \|x - y\|^2, \quad \text{s.t.} \quad x^\top \mathbf{1} = 1, \quad x \geq 0. \quad x$$

### KKT Conditions

The Lagrangian is given by:

$$L = \frac{1}{2} \|x - y\|^2 - \sum_i \lambda_i x_i + \nu(x^\top \mathbf{1} - 1)$$

Taking the derivative of  $L$  with respect to  $x_i$  and writing KKT yields:

- $\frac{\partial L}{\partial x_i} = x_i - y_i - \lambda_i + \nu = 0$
- $\lambda_i x_i = 0$
- $\lambda_i \geq 0$
- $x^\top \mathbf{1} = 1, \quad x \geq 0$

#### Question

Solve the above conditions in  $O(n \log n)$  time.

#### Question

Solve the above conditions in  $O(n)$  time.
